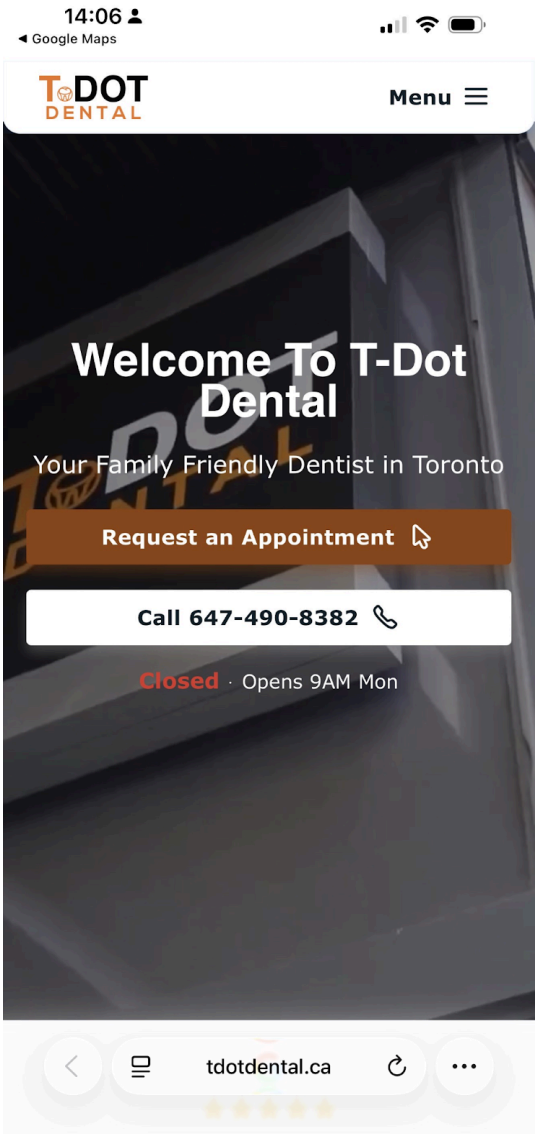
Project Title: Bright Smile Dental Mobile and Watch App

Secondary research

T-Dot Dental Mobile Booking Flow Homepage

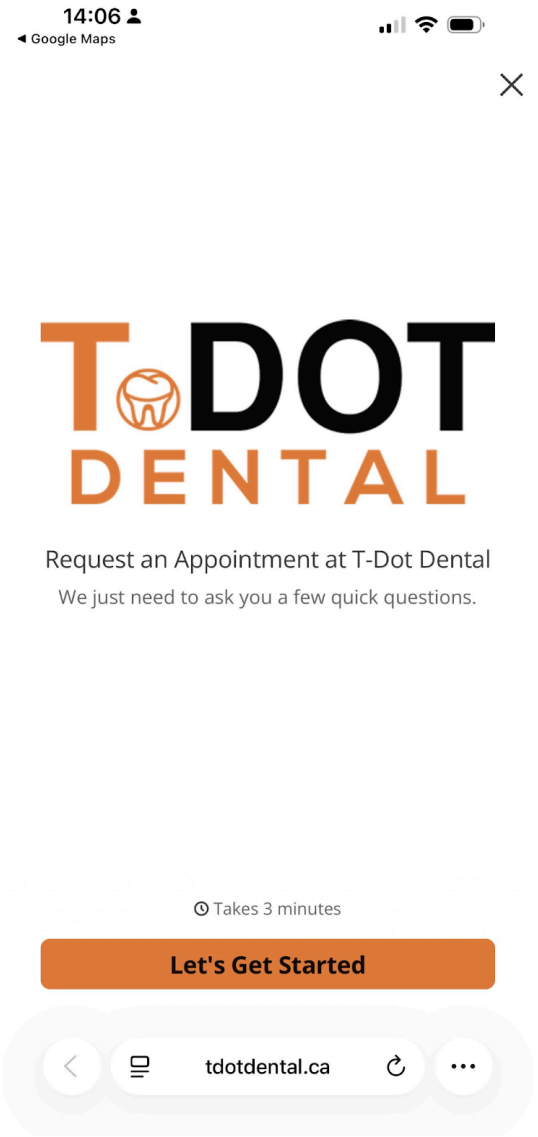
This source looks at the mobile website and booking request flow of T-Dot Dental. I used it to study how a real dental clinic presents key information and guides patients through an appointment request process.



Homepage

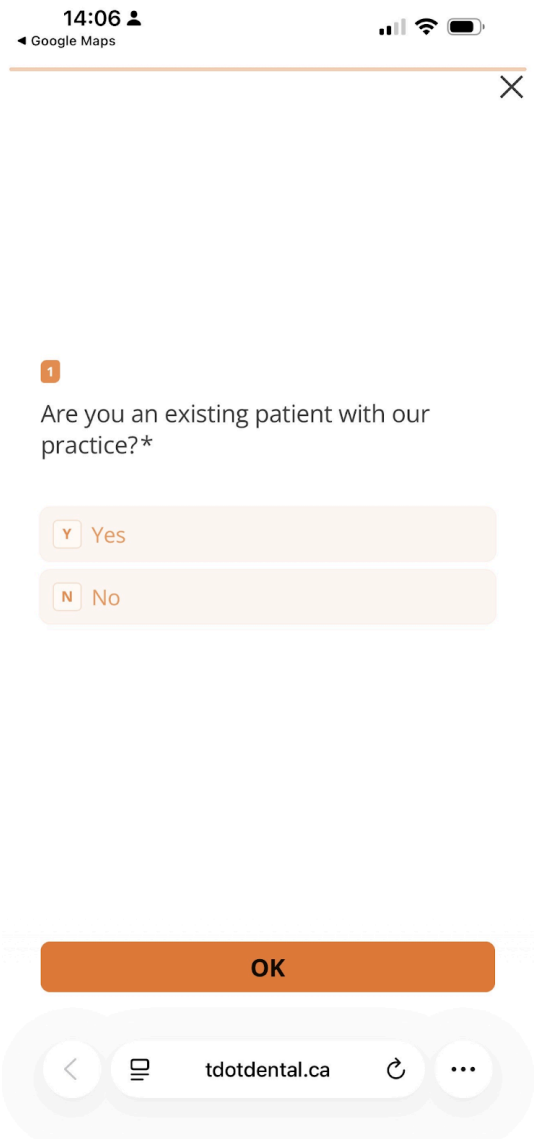
The homepage puts the most important tasks right at the front. The request for an appointment button, phone number, and office hours are all visible right away. This makes the site easy to use for patients who mainly want to book, call, or quickly check if the clinic is

open. For my own design, this shows that the home screen should focus on the most common tasks first instead of making users search through too much information.



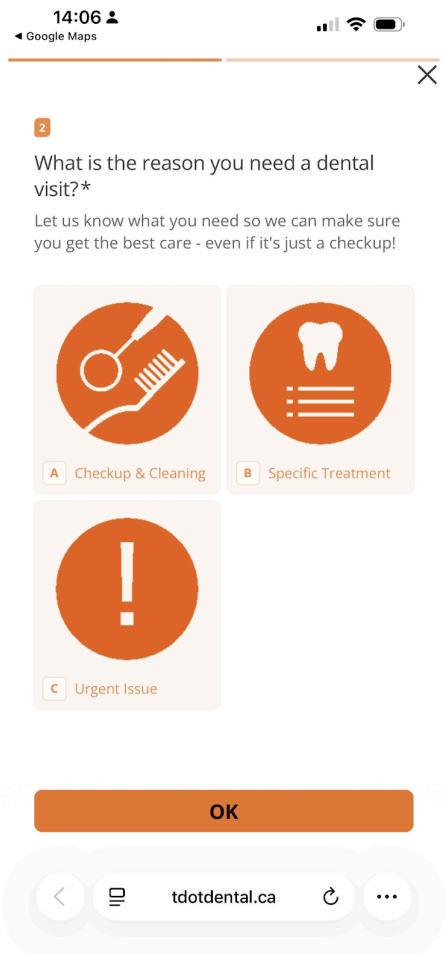
Booking Entry

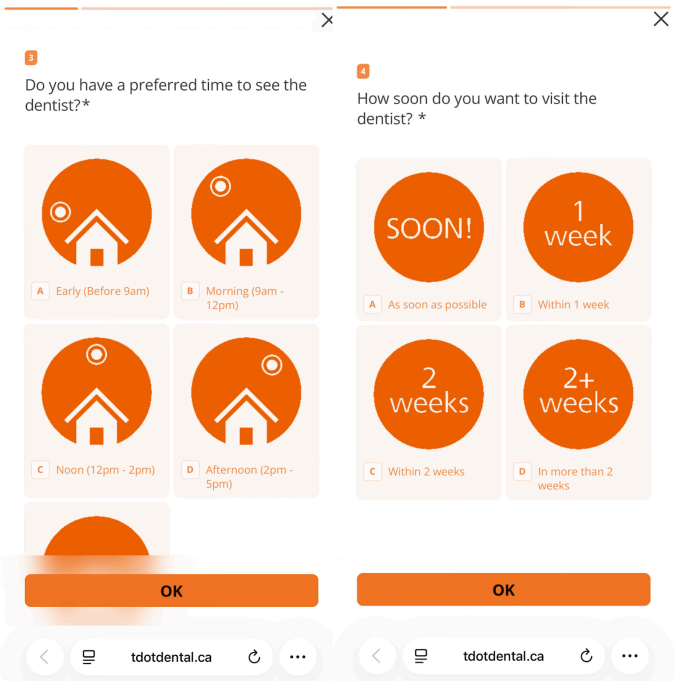
The booking entry screen makes the process feel simple before it even begins. It tells users that the form only takes about 3 minutes and uses a clear lets get started button. This lowers the pressure of starting a medical form and makes the task feel manageable. For my own design, I want the booking flow to feel short, clear, and low stress from the first screen.



Patient Type

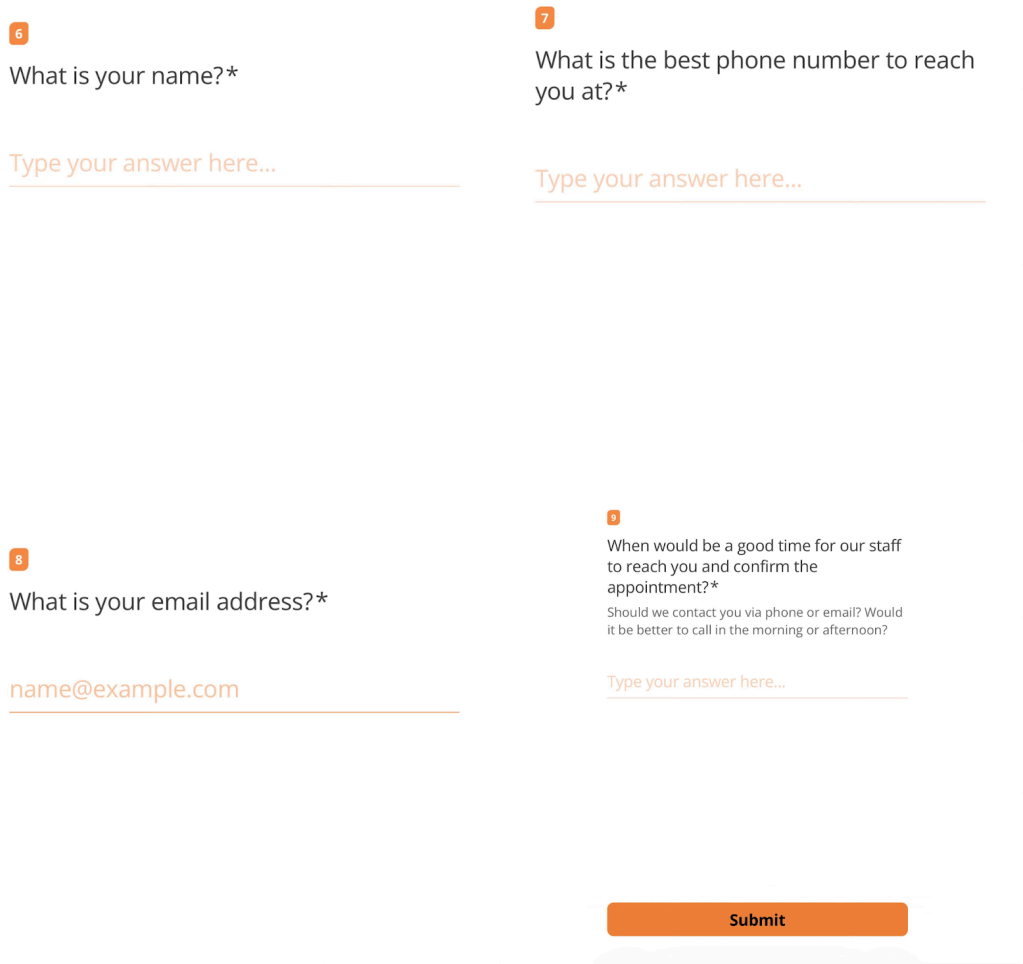
The first question asks whether the person is already a patient. This is a smart way to separate users early and avoid making everyone go through the same workflow. Existing patients and new patients usually need different steps, so this kind of branching helps make the process more efficient. For my own design, I should separate new patient registration from existing patient booking as early as possible.





Appointment Preferences

The next screens ask about the reason for the visit, preferred time, and how soon the patient wants to come in. Instead of forcing the user to choose an exact appointment slot right away, the clinic first collects preferences and lets staff confirm the final booking later. This matches how many real clinics actually work. For my own design, this suggests that the app should focus on collecting clear booking preferences first, then provide confirmation after staff review.



Contact Information

The last part of the flow asks for basic contact details like name, phone number, email, and the best time to be reached. This keeps the form focused on only the information needed to follow up and confirm the appointment. That helps reduce unnecessary input and makes the process easier on mobile. At the same time, some parts could be clearer, like the

repeated OK button label and the very light placeholder text. For my own design, I want the form to stay short, but I also want button labels and text contrast to be clearer.

Overall, this source helped me understand how a dental clinic can make appointment requests feel simple, structured, and low stress on mobile.

Smartwatch Design Principles

This source focuses on general smartwatch design principles rather than one specific dental app. Smartwatches work best for quick and glanceable tasks, especially reminders, short updates, and simple actions. Because the screen is small and text input is limited, they are not a good place for long forms or detailed account management. For my own design, this means the watch app should focus on appointment notifications, quick appointment details, and simple cancellation actions instead of trying to copy the full mobile experience.

For this project, the smartwatch should act as a companion to the mobile app, not a smaller version of it. This also matches Apple's watchOS guidance, which emphasizes timely information, focused content at a glance, and simple, predictable navigation.

Design Pitch

Problem: Many clinics still use phone calls to manage appointments, which often results in missed calls, no-shows, and unhappy patients. At the same time, more patients from different backgrounds now expect easy digital self-service. However, clinics still need staff involved in scheduling, so there is a gap between what patients want and how clinics operate.

Proposed Solution: We propose a mobile app and companion smartwatch MVP that helps balance patient independence with clinical oversight. The app uses simple onboarding and gentle smartwatch reminders to make scheduling easier, reduce missed appointments, and keep patients informed about their schedules.

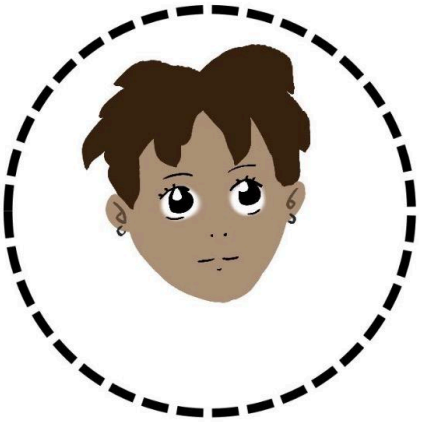
Justification of Features:

- New Patient Registration & Booking Confirmations (Mobile): When someone submits a registration or booking request, a message pops up right away to let them know that office staff will call to confirm the appointment. This helps set clear expectations and reassures users that the app is working as intended.
- Appointment Booking & Management (Mobile): To make things easier for returning patients, the booking screen has a simple menu where they can choose their dentist. On the management screen, we use clear color codes to show the difference between a pending request and a confirmed appointment.
- Patient Account & Office Information (Mobile/Watch): A single profile and an easy-to-use clinic directory help build trust and transparency. Patients can quickly find clinic hours and contact information on any device.
- Upcoming Appointments List & Reminders (Watch): To keep things simple, the watch face shows no more than two upcoming appointments. It uses a custom haptic notification system: a gentle pulse one day before, and a stronger vibration one hour before, helping users stay on track without feeling overwhelmed.

- Appointment Details & Cancellation Prompt (Watch): The watch interface includes a clear "Cancel" button for quick actions, but a warning dialog appears before anything is canceled. This gives users control and helps prevent accidental data loss from wrist movement.

Proto-Persona

Proto-Persona Template



[Sketch, name role]

John Smith the "Efficiency-Driven" Patient

[Factors that influence behaviour, such as demographics, goals]

- Demographics: 32 years old, working professional living in San Francisco, CA. Highly tech-savvy, values operational transparency and convenience.
- Behaviors: Uses his mobile phone and smartwatch to keep his busy workday organized. Likes digital self-service options that let him respond on his own time, instead of making phone calls. Often handles personal admin tasks while doing other things.
- Goals: Wants a simple way to update his new home address and book his bi-annual cleaning with his assigned provider, Dr. Sarah Johnson, without any hassle or dealing with phone menus.

[Needs, obstacles, desires]

Pain Points:

- Hates being put on hold when calling medical offices.
- Struggles to remember appointments unless he receives active, contextual reminders.
- Experiences "perceived system failure" and frustration if an app doesn't immediately confirm that his data was received.

Scenario: John just moved to a new apartment on Oak Avenue. On his morning train ride, he remembers to update his clinic file and book a check-up. He opens the dental app, goes to Patient Account Settings, and updates his street address and zip code. Next, he requests an appointment with Dr. Johnson. A clear message lets him know his profile is updated and that staff will call to confirm the booking. This gives him peace of mind before he even gets off the train.

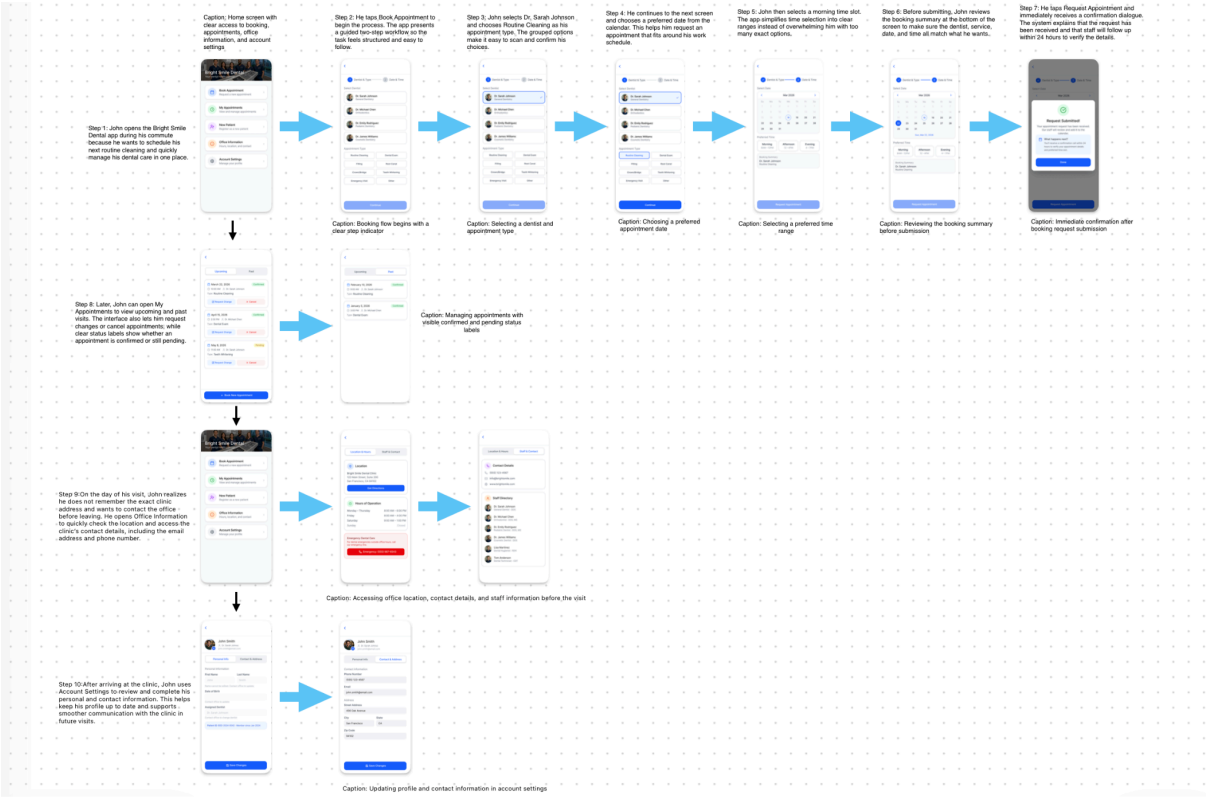
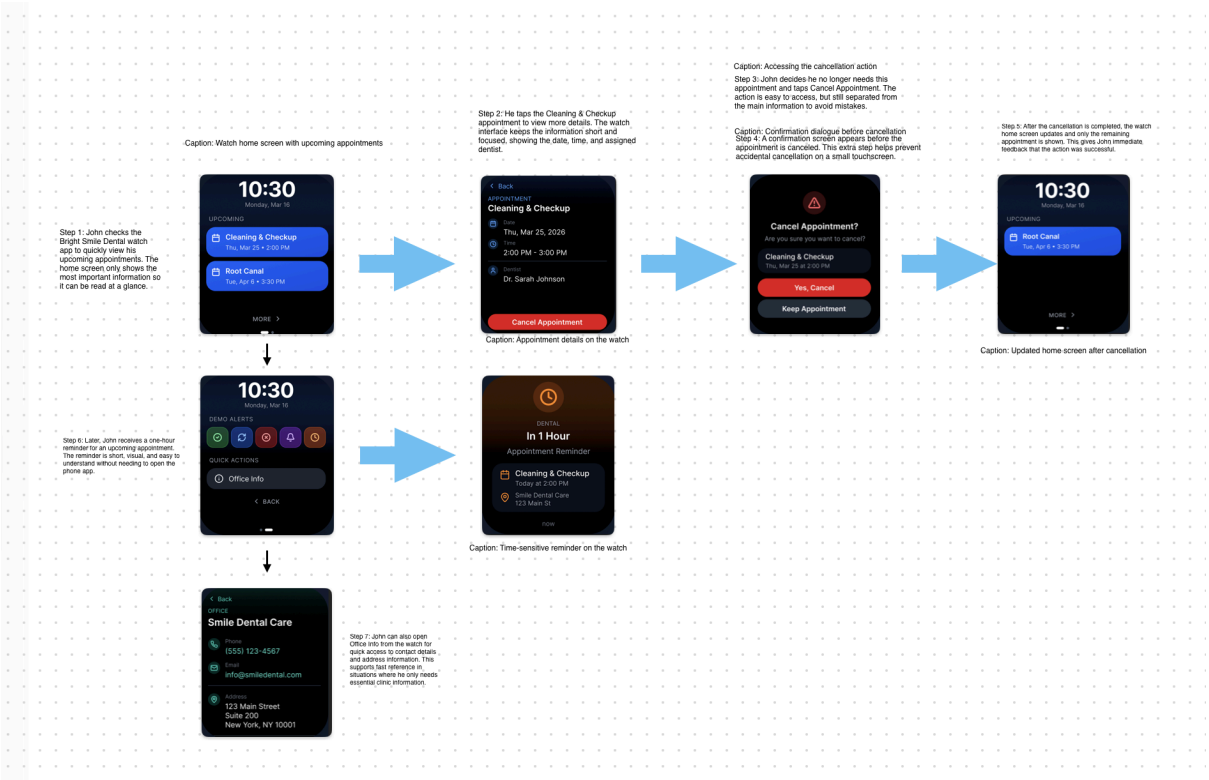
High-Fidelity Prototype Sequential Storyboard (iOS)



High-Fidelity Prototype Sequential Storyboard (watchOS)



Storyboard: John Smith Books a Cleaning Appointment (iOS)

Step 1: John opens the Bright Smile Dental app during his commute because he wants to schedule his next routine cleaning and quickly manage his dental care in one place.

Step 2: He taps Book Appointment to begin the process. The app presents a guided two-step workflow so the task feels structured and easy to follow.

Step 3: John selects Dr. Sarah Johnson and chooses Routine Cleaning as his appointment type. The grouped options make it easy to scan and confirm his choices.

Step 4: He continues to the next screen and chooses a preferred date from the calendar. This helps him request an appointment that fits around his work schedule.

Step 5: John then selects a morning time slot. The app simplifies time selection into clear ranges instead of overwhelming him with too many exact options.

Step 6: Before submitting, John reviews the booking summary at the bottom of the screen to make sure the dentist, service, date, and time all match what he wants.

Step 7: He taps Request Appointment and immediately receives a confirmation dialogue. The system explains that the request has been received and that staff will follow up within 24 hours to verify the details.

Step 8: Later, John can open My Appointments to view upcoming and past visits. The interface also lets him request changes or cancel appointments, while clear status labels show whether an appointment is confirmed or still pending.

Step 9: On the day of his visit, John realizes he does not remember the exact clinic address and wants to contact the office before leaving. He opens Office Information to quickly check the location and access the clinic’s contact details, including the email address and phone number.

Step 10: After arriving at the clinic, John uses Account Settings to review and complete his personal and contact information. This helps keep his profile up to date and supports smoother communication with the clinic in future visits.

Storyboard: John Smith Managing Appointments (watchOS)

Step 1: John checks the Bright Smile Dental watch app to quickly view his upcoming appointments. The home screen only shows the most important information so it can be read at a glance.

Step 2: He taps the Cleaning & Checkup appointment to view more details. The watch interface keeps the information short and focused, showing the date, time, and assigned dentist.

Step 3: John decides he no longer needs this appointment and taps Cancel Appointment. The action is easy to access, but still separated from the main information to avoid mistakes.]

Step 4: A confirmation screen appears before the appointment is canceled. This extra step helps prevent accidental cancellation on a small touchscreen.

Step 5: After the cancellation is completed, the watch home screen updates and only the remaining appointment is shown. This gives John immediate feedback that the action was successful.

Step 6: Later, John receives a one-hour reminder for an upcoming appointment. The reminder is short, visual, and easy to understand without needing to open the phone app.

Step 7: John can also open Office Info from the watch for quick access to contact details and address information. This supports fast reference in situations where he only needs essential clinic information.

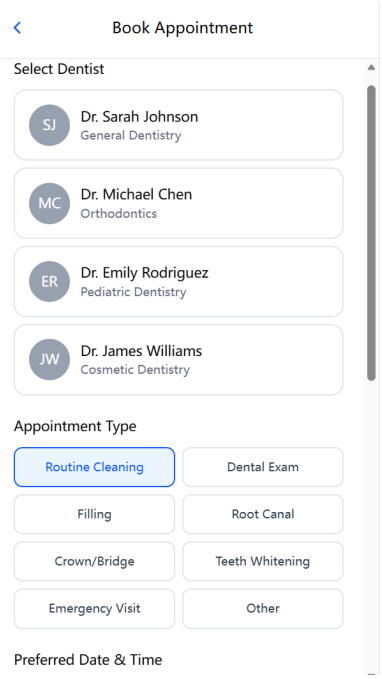
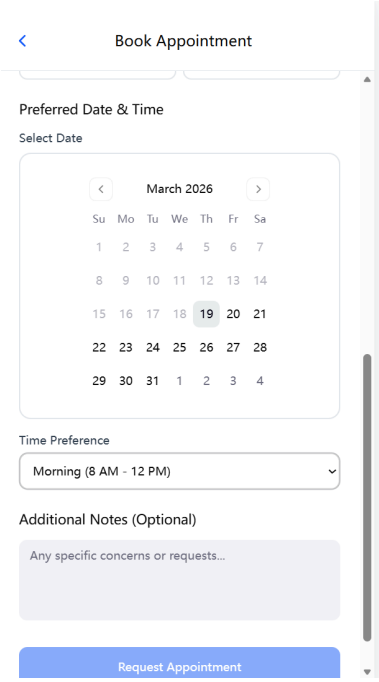
Evidence of Iterative Feedback (iOS)



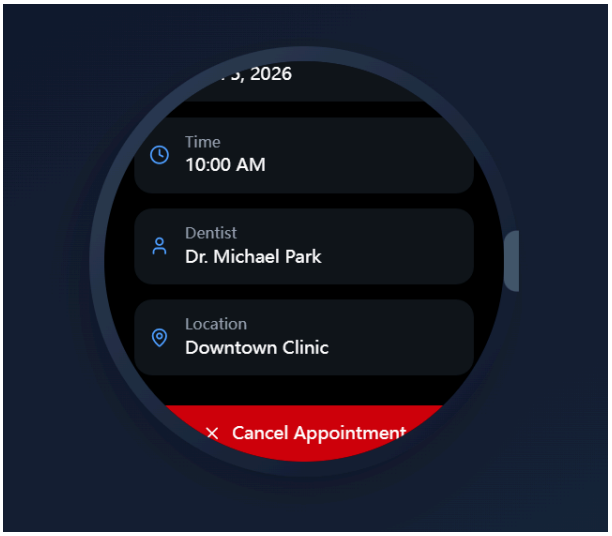


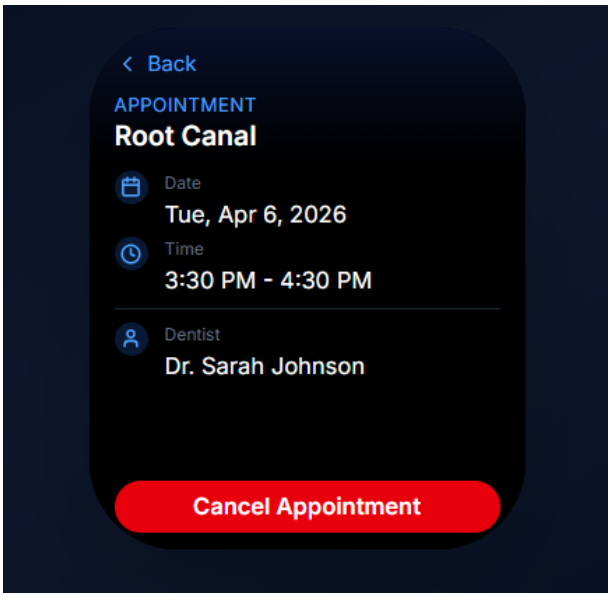
During the design process, the mobile booking flow was changed from a single long form to a step-by-step workflow. Previously, users selected the dentist, appointment type, date and time, and optional notes on one screen. While this consolidated information, it resulted in a lengthy form and required users to process too much information at once.

After revision, the booking process was divided into separate steps. Users first select a dentist and appointment type, then proceed to a second screen for date and time selection. This structure reduces cognitive load by allowing users to focus on one decision at a time.

This iteration improved the design in three ways: it reduced visual clutter on mobile, clarified the sequence of user actions, and introduced a stronger sense of progress, making the process easier and more manageable.

Evidence of Iterative Feedback (watchOS)





During the design process, the appointment detail screen was revised to better suit smartwatch constraints. The initial layout used a circular frame and displayed several information blocks at once, including time, dentist, location, and a cancel action. While comprehensive, this approach resulted in a crowded interface, making the lower section difficult to read as the cancel button competed with appointment details for attention.

In response to feedback, the updated version adopts a cleaner rectangular Apple Watch layout with a clearer hierarchy. The appointment title appears at the top, followed by key details such as date, time, and dentist in a structured vertical order. This arrangement improves scanability and reduces visual clutter. The cancel button remains visible but is now more effectively separated from the informational content, reducing the risk of accidental taps.

This iteration improved the watch design in three ways: it made appointment details easier to read at a glance, established a clearer hierarchy between information and actions, and created an interface better suited to a smartwatch environment rather than a compressed mobile layout. These changes support the overall goal of making the app simple, focused, and low-stress.

The AI generated profile photos of individual dentists, including named individuals Sarah Johnson, Michael Chen, Emily Rodriguez, James Williams, Lisa Martinez, and Tom Anderson, as well as an unnamed white woman dentist (Google, 2026).

High-end, high-tech, and minimalist background images for a dental clinic were created (Google, 2026).

The tool produced a rectangular group photograph featuring all the generated dental staff smiling together (Google, 2026).

A profile picture based on the dental staff group image composition was generated (Google,2026).

The AI also created a profile picture of a college man (Google, 2026).
